Miniaturized Mobile Robot for Educational Applications in Logistics

CROS 2026 - Brazilian Conference on Robotics

João Pessoa, Brazil

April 27–30, 2026

César Grossl (UTFPR)
Dieisson Martinelli (UDESC)
Vivian Cremer Kalempa (UDESC)
André Schneider de Oliveira (UTFPR)

Motivation

- Internal logistics still relies on human-operated forklifts.
- Material handling is subject to errors, safety risks, and inefficiencies.
- Mobile robots can improve repeatability and operational support.
- A miniaturized prototype provides a practical platform for education and research.

UDESC UNIVERSIDADE DO ESTADO DE SANTA CATARINA

UTFPR UNIVERSIDADE TECNOLÓGICA FEDERAL DO PARANÁ CAMPUS CURITIBA

Objective

- Design and develop a miniaturized robotic platform for logistics.
- Integrate LiDAR, ultrasonic sensors, and ROS 2 for perception and navigation.
- Experimentally validate the system using SLAM.

UTFPR UNIVERSIDADE TECNOLÓGICA FEDERAL DO PARANÁ CAMPUS CURITIBA

Prototype Design and Fabrication

- The chassis was designed in CAD and 3D printed in PLA.
- The miniaturized prototype uses four DC motors for differential drive and one motor for fork lifting.
- Its compact dimensions of 24 cm in length, 22 cm in height, and 1.35 kg in mass make it suitable for reduced-scale experimental validation.

Hardware Components

- Raspberry Pi 4 as central processing unit.
- LiDAR (RPLiDAR C1) for mapping and navigation.
- Ultrasonic sensors for obstacle detection.
- Intel RealSense D435i for depth perception and pallet detection.
- DC motors and encoders for movement and odometry.
- Motor drivers (TB6612FNG and L298N) for motion and fork control.
- Supporting components: power bank, limit switch, buzzer, and connector

Physical prototype of the mobile robot

Mapping (SLAM)

- LiDAR-based 2D environment mapping
- Real-time data acquisition via ROS 2
- Map generation and localization using RViz2
- Integration with odometry for position estimation

RViz2 visualization of LiDAR-based SLAM

Experimental mapping environment

Tests and Validation

- Assembly tests were performed to verify the correct positioning of mechanical and electronic components.
- Individual validation of sensors, motors, and control modules was carried out before full integration.
- Movement tests were conducted to adjust motor control and calibrate odometry.
- Obstacle detection tests were performed using front, rear, and side ultrasonic sensors.
- SLAM mapping and navigation were validated in RViz using 2D Pose Estimate and Nav2 Goal.

Conclusion

- The proposed prototype demonstrated the feasibility of a miniaturized mobile robot for logistics applications.
- The system successfully integrated sensors, embedded electronics, and ROS 2 architecture.
- Experiments validated SLAM-based mapping, obstacle detection, and navigation.
- The platform showed potential for educational and research applications in robotics and logistics.

Future Work

- Improve odometry accuracy and navigation stability.
- Enhance SLAM performance for more accurate environment mapping.
- Implement pallet detection using the Intel RealSense D435i camera.
